

# Key Concepts for Informed Choices

A framework for taking decisions based on thinking critically about claims and comparisons. (from [Nature, 2019](#))

<b>Claims</b> <i>Claims about effects should be supported by evidence from fair comparisons. Other claims are not necessarily wrong, but there is an insufficient basis for believing them.</i>	<b>Comparisons</b> <i>Studies should make fair comparisons, designed to minimize the risk of systematic errors (biases) and random errors (the play of chance).</i>	<b>Choices</b> <i>What to do depends on judgements about the problem, the relevance (applicability or transferability) of the evidence available, and the balance of expected benefits, harms and costs.</i>
<p><b>Claims should not assume that interventions are safe, effective, or certain.</b></p> <ul style="list-style-type: none"> <li>Interventions can cause harms as well as benefits.</li> <li>Large, dramatic effects are rare.</li> <li>We can rarely, if ever, be certain about the effects of interventions.</li> </ul> <p><b>Seemingly logical assumptions are not a sufficient basis for claims.</b></p> <ul style="list-style-type: none"> <li>Beliefs alone about how interventions work are not reliable predictors of the presence or size of effects.</li> <li>An outcome may be associated with an intervention but not caused by it.</li> <li>More data is not necessarily better data.</li> <li>The results of one study considered in isolation can be misleading.</li> <li>Widely used interventions or those that have been used for decades are not necessarily beneficial or safe.</li> <li>Interventions that are new or technologically impressive may not be better than available alternatives.</li> <li>Increasing the amount of an intervention does not necessarily increase its benefits and may cause harm.</li> </ul> <p><b>Trust in a source alone is not a sufficient basis for believing a claim.</b></p> <ul style="list-style-type: none"> <li>Competing interests may result in misleading claims.</li> <li>Personal experiences or anecdotes alone are an unreliable basis for most claims.</li> <li>Opinions of experts, authorities, celebrities, or other respected individuals are not alone a reliable basis for claims.</li> <li>Peer review and publication by a journal do not guarantee that comparisons have been fair.</li> </ul>	<p><b>Comparisons of interventions should be fair.</b></p> <ul style="list-style-type: none"> <li>Comparison groups and conditions should be as similar as possible.</li> <li>Indirect comparisons of interventions across different studies can be misleading.</li> <li>The people, groups or conditions being compared should be treated similarly, apart from the interventions being studied.</li> <li>Outcomes should be assessed in the same way in the groups or conditions being compared.</li> <li>Outcomes should be assessed using methods that have been shown to be reliable.</li> <li>It is important to assess outcomes in all (or nearly all) the people or subjects in a study.</li> <li>When random allocation is used, people's or subjects' outcomes should be counted in the group to which they were allocated.</li> </ul> <p><b>Syntheses of studies should be reliable.</b></p> <ul style="list-style-type: none"> <li>Reviews of studies comparing interventions should use systematic methods.</li> <li>Failure to consider unpublished results of fair comparisons may bias estimates of effects.</li> <li>Comparisons of interventions may be sensitive to underlying assumptions.</li> </ul> <p><b>Descriptions should clearly reflect the size of effects and the risk of being misled by the play of chance.</b></p> <ul style="list-style-type: none"> <li>Verbal descriptions of the size of effects alone can be misleading.</li> <li>Small studies may be misleading.</li> <li>Confidence intervals should be reported for estimates of effects.</li> <li>Deeming results to be "statistically significant" or "nonsignificant" can be misleading.</li> <li>Lack of evidence of a difference is not the same as evidence of "no difference".</li> </ul>	<p><b>Problems, goals and options should be defined.</b></p> <ul style="list-style-type: none"> <li>The problem should be diagnosed or described correctly.</li> <li>The goals and options should be acceptable and feasible.</li> </ul> <p><b>Available evidence should be relevant.</b></p> <ul style="list-style-type: none"> <li>Attention should focus on important, not surrogate, outcomes of interventions.</li> <li>There should not be important differences between the people or subjects in studies and those to whom the study results will be applied.</li> <li>The interventions compared should be similar to those of interest.</li> <li>The circumstances in which the interventions were compared should be similar to those of interest.</li> </ul> <p><b>Expected pros should outweigh cons.</b></p> <ul style="list-style-type: none"> <li>Weigh the benefits and savings against the harms and costs of acting or not.</li> <li>Consider how these are valued, their certainty, and how they are distributed.</li> <li>Important uncertainties about the effects of interventions should be reduced by further fair comparisons.</li> </ul> <p style="text-align: right;"><a href="#">How this framework was developed</a></p>
